

Backup Documents

A feature available with N-able Backup

N-able™ Backup Documents finds and backs up critical business documents on workstations, helping protect your customers from data loss where full workstation system backup is not an option. It's the easy, automated, and affordable way to provide basic protection for important business documents.

Back up numerous types of business documents

- Microsoft Office®, QuickBooks®, and Outlook® .PST files are automatically found and backed up, from the Documents folder or anywhere on the workstation.
- Open Office™, Visio®, and Mac® file types are also protected.
- For a full list of supported file types, see: <https://documentation.n-able.com/backup/documentation/Content/backup-manager/backup-documents/files.htm>

Manage backups and restore data from the same dashboard as servers, full workstations, and microsoft 365® data.

- Save administrative time by using the same management console for all backups, including documents.
- Document backups are stored in the N-able private cloud, and your license includes unlimited cloud storage space.
- Verify backup status at a glance, across all your customers.

Automate and simplify document protection

- Backups run automatically twice each day—nothing to configure or customize.
- Automatic 28-day retention provides you with 56 restore points for recovery.
- Optional end-user self-service lets users perform routine document recovery without calling the help desk.

Protect your most cost-conscious customers

- While full workstation backups are preferred, not all customers are willing to make the investment. Backup Documents is an affordable alternative.
- Set it up in the background for any unprotected workstations and roll it into the cost of your basic managed services contract. Unlimited data storage is included in the price.
- Be ready to respond when ransomware or hardware failure strikes.
